

HOW DOES YOUR SUPPLIER TEST THEIR PACKS?

6
FEET

6
SIDES

6
TIMES

Sudden drops and impacts are some of the most common occurrences faced by radio batteries. BatteryJack batteries are constructed to handle drops due to their superior construction, highest quality components, and internal shock resistant materials.

How do we do it? BatteryJack technicians drop each battery from 6 feet, on all 6 sides, 6 times on a concrete surface.

Each battery is inspected for damage after every cycle of drops, looking for:

- Broken casings
- Inability to Charge
- Proper fit on radio
- Inability to Discharge
